Please search the following:

- 1. SEQ ID NO: 1 and 2.
- 2. the sequence from nucleotide position 1 to nucleotide position 1311 of SEQ ID NO: 1 or 2.
- 3. the sequence from nucleotide position 1155 to nucleotide position 1311 of SEQ ID NO: 1 or 2.
- 4. the sequence from nucleotide position 1179 to nucleotide position 1208 of SEQ ID NO: 1 or 2.
- 5. the sequence from nucleotide position 1239 to nucleotide position 1278 of SEQ ID NO: 1 or 2.
- 6. an oligo of SEQ ID NO: 1 or 2.

Please search both commercial and patent (including pending) databases. Thanks

Medina A. Ibrahim Patent Examiner, GAU-1638 transgenic plants and plant breeding Remsen-2B07 mailbox-2C18 (571) 272-0797

This consensus is derived from a shotgun assembly that has been manually curated. It is the best representation of the BAC that we can generate without further laboratory work. The draft assembly has been edited, and if possible, ends identified by vector as well as by BAC end sequences, and contigs ordered and oriented. Bases that are not Ns are either above Q20 or manually edited. This assembly was performed with Arachne (Genome Res. 2002 12: 177-189; Genome Res. 2003 13: 91-96). All trace files for this project are available at the NCBI trace repository (http://www.ncbi.nlm.nih.gov/Traces/trace.fcgi?). An exact list of reads used in this assembly are available at http://www.broad.mit.edu/annotation/plants/maize/randomclones.html.
                                                                                                                                                                                                                                                    * This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Submitted (17-AUG-2004) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA On Aug 17, 2004 this sequence version replaced gi:49658659. All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      http://ftp.genome.washington.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Web site: http://www-seq.wi.mit.edu Contact: sequence_submissions@broad.mit.edu

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence is that encoding an M845 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably M845), which encodes a product selected from auxins, rolB and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile

and infertile plants

New nucleic acid encoding a Ms45 male tissue-preferred regulatory region - useful in mediating plant fertility, especially hybrid seed production.

                                                  The sequence is that encoding an M845 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably M845), which encodes a product selected from auxins, rolls and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile and infertile plants

                                                                                                                                                                   The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a nucleic acid sequence encoding an Ms45 martissue preferred regulatory region from Z. mays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    M845; male tissue;

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a nucleic acid sequence encoding an Ms45 martissue preferred regulatory region from Z. mays
                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 1394
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ms45; male tissue; hybrid seed; ds.

A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a Z. mays MS45 promoter fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ms45; male tissue; regulatory region; transcription; male fertility; hybrid seed; promoter; ds.

A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a DNA fragment -38 to -195 bases upstream of the TATA box of a Z. mays Ms45 male-tissue preferred regulatory region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.

                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (S1). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an isolated polynucleotide comprising a CC first, second, third, fourth or fifth nucleotide sequence, or their CC complement encoding a polypeptide either having flowering locus T gene CC (FT), terminal flower (TFL), or Apetala3 (Ap3) homologue activity. Also CC composenting a cell with the polynucleotide; (3) transforming a cell by transforming a cell with the polynucleotide; (3) transforming a cell by CC transforming a cell with the polynucleotide; (4) a cell comprising the CC recombinant DNA construct; (5) producing a plant comprising transforming to a plant cell; (6) a plant comprising the recombinant DNA construct; (7) a seed comprising the recombinant DNA construct; (7) a seed comprising a first nucleotide sequence contains at least 30 nucleotides, and where the CC first nucleotide sequence is comprised by another polynucleotide, where the other polynucleotide includes the second, third, fourth, fifth or CC sixth nucleotide sequence; (9) an isolated polypeptide having FT or Ap3 CC encoded by the polynucleotide comprising isolating the polypucleotide comprising isolating a polypeptide containing a recombinant DNA construct comprising the polypucleotide from a cell containing a recombinant DNA construct comprising the polypucleotide coperably linked to a regulatory sequence. The polynucleotides are useful for floral development, e.g. engineering plant sterility/fertility, cc flowering time, plant growth rate of cell division to enhance cc culcure morphology and the rate of cell division to enhance construct comprise and plant sterility enhances are useful concleotide sequence from the present sequence represents an FT homologue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC the production of male sterile plants. The method comprises selective coparably linked to a separate promoter, whereby the first promoter causes tolerance to glyphosate. The method uses two DNA molecules, each coparably linked to a separate promoter, whereby the first promoter copyphosate, and the second promoter functions in plant cells to produce a protein that causes tolerance to glyphosate, and the second promoter functions in plant cells to cause the production of a second RNA sequence in a male reproductive tissue.

CC Expression of the DNA promotes tolerance to glyphosate in those tissues in which it is expressed. Expression of the second DNA molecule causes the production of an RNA sequence which can inhibit the glyphosate couses the production of an RNA sequence which can inhibit the glyphosate copyphosate tolerance generated by expression of the first DNA molecule. By using a component for the second DNA molecule which restricts the production of the antisense RNA to only a subset of the tissues which express the first CNA molecule, only the subset of the sissues which express the first CNA molecule, only the subset of the tissues which express the first CNA molecule, only the subset of tissues in which the second DNA molecule is expressed will be susceptible to glyphosate toxicity. In this way, a component of the plants for use in the production of the producting upon the component of the plants for use in the production of hybrid seed, for minimizing cundesirable crop outcrossing, and for lengthening flower life. The methods can be used wit h plants such as corn, wheat, rice, canola, oat, barley, alfalfa, carrot, cotton, oilseed, oilseed rape, sugarbeet, cotton, oilseed, oilseed rape, sugarbeet, conditions to continue and squash
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

CC illustrate the role of the dul locus in starch biosynthesis, a transposon CC tagging strategy was used to isolate the gene and describe its collection reports tagging of the dul locus with CC polypoptide product. The invention reports tagging of the dul locus with CC mutransposon, cloning and characterisation of a portion of the gene, and sequence (see AAY06199) deduced from this cDNA indicates that Dul codes CC for a 186 kDa protein extremely similar to potato tuber starch synthase CC endosperm. The Dul product contains unique sequence features in its N-cc multiple aspects of starch biosynthetic enzymes. Mutations within the maize SIII gene affect CC multiple aspects of starch biosynthase(s), starch branching enzyme(s) and possibly starch debranching enzyme(s). The isolated cDNA can be used to provide an cc enzyme with which to regulate the production of starch, and with which to produce altered or novel forms of starch, e.g. in transgenic plants. CC Expression of Dul in bacteria and yeasts also modifies glycogen it that code for functional portions of DUI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                          improved affinity to starch and modified catalytic capabilities and to the in vivo and in vitro synthesis of glucan chains of modified lengths as compared to plants producing native starch or starch produced with native starch synthases. Expression of the starch synthase fusion proteins along with granule bound starch synthase (GBSS) will lead to a modified starch having an altered or improved morphology, retrogradation, waterbinding, or swelling potential of the granules, gel strength, adhesiveness, cohesiveness, hardness, elasticity, increased or decreased granule size, degree of branching, crystallinity, degree of cross-linking, and increased or decreased glucan chain lengths. This sequence encodes a starch synthase used in the invention
                                                                                                                                                                                                                 protein consisting of 4 different functional domains selected from glucan association domain (GLASS), linker domain (LINKR), glucosyl transferase domain (GTYTR), and C-terminal end (CTEND) which are operably linked to one another. The DNA molecule is useful for expressing in plants polypeptides including starch synthase enzymes as fusion proteins with
                                                                                                                                                                                                                                                                                                                                                                                         New DNA encoding fusion protein consisting of 4 different functional domains selected from glucan association domain, linker domain, gluce transferase domain, and C-terminal end, useful for producing modifies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       granule bound starch synthase; GBSS; morphology; retrogradation; waterbinding; swelling potential; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Starch; starch synthase; glucan association domain; GLASS; linker domain; LINKE; glucosyl transferase domain; GLYTR; C-terminal end; CTEND;

The DUI polypeptide has starch synthase activity, and comprises an N-terminal arm region, a C-terminal catalytic region, and a region of about 900 amino acids terminating with the catalytic region. The C-terminal catalytic region has a catalytic domain comprising alpha-1,4-glycosyltransferase catalytic activity. The dull polymucleotide sequence is useful in producing starch e.g. from a
                                                                                                                                                                                                                                                                  Sequence

ID ABX35
CC of polyadenylated ribonuclectides to a 3' end of the mRNA molecule; and CC (2) determining a level or pattern of a molecule in a bovine cell or CC tissue comprising: (a) incubating a marker nucleic acid (comprising any CC of the 15112 nucleic acid sequences or its complement or fragment) with a CC complementary nucleic acid molecule obtained from the bovine cell or CC tissue, where hybridisation between the marker nucleic acid and the CC complementary nucleic acid molecule obtained from the bovine cell or CC detecting the level or pattern of the complementary nucleic acid, where CC level or pattern of the molecule; and is used for CC determining a level or pattern of a molecule; acid is used for CC it is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or CC it is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or CC isometric texpressed sequence is one of the CC isometric sequence was not shown in the specification but was obtained in CC electronic format from the USPTO web site:
                                                                                                                                                                                                                                                                                                                                                                                               lactation or muscle and fat deposition (designated LMPD), derived from cattle, and the LMPD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are (1) a transformed cell having a nucleic acid comprising an LMPD nucleic acid linked to a promoter and a 3, non-translated sequence that functions in the cell to cause termination of transcription and addition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid associated with lactation, and muscle and deposition, useful for genome mapping, gene identification cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gene

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines or other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or eptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haemacpoiesis regulating activity, tissue growth factor activity, hamboropoiesis regulating activity itseue growth factor activity, immunomodulatory activity and activity inhibbin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
